- Reflects **joint work** with: Javiera Cartagena-Farías; Francesco D'Amico, Sanna Read, Amritpal Rehill, Sam Rickman, Tom Snell
- **5 local authorities** in England
- **Disclaimer:** This presentation summarises independent research funded by the National Institute for Health Research School for Social Care Research. The views expressed are those of the author(s) and not necessarily those of the NIHR SSCR, the National Institute for Health Research or the Department of Health and Social Care.

The key WHAT questions in the Production of Welfare

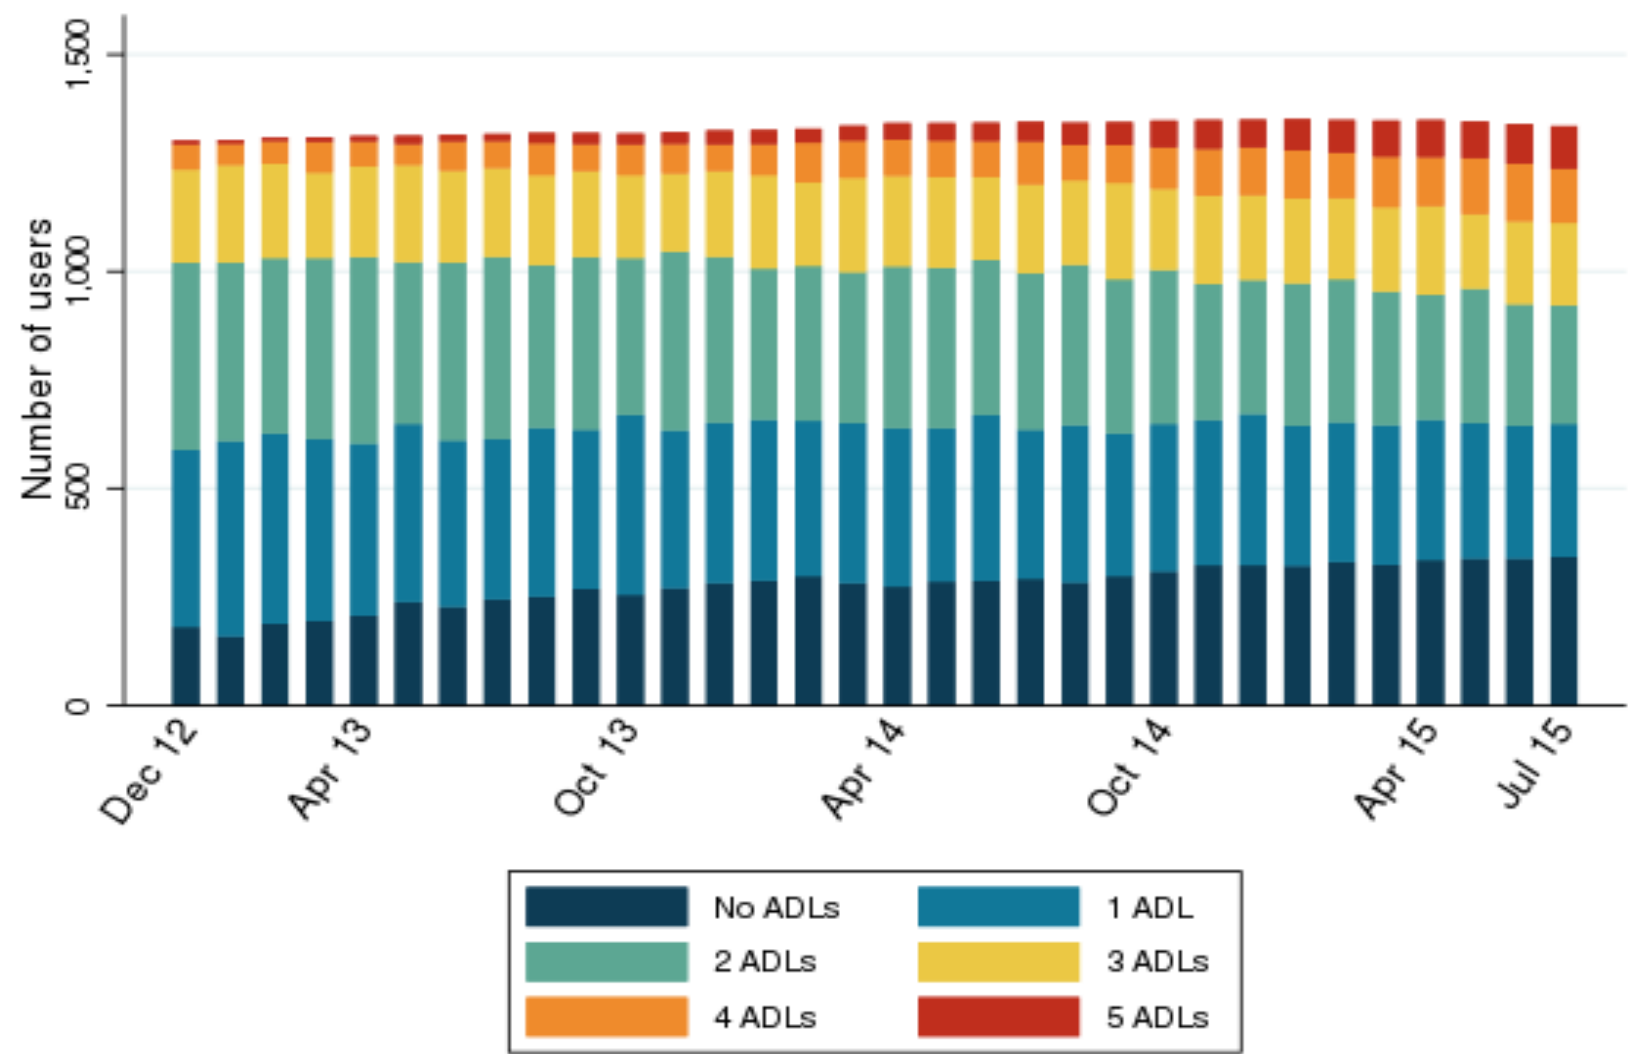

The key WHAT questions in the Production of Welfare

Why don't we  
know more about  
the production of  
welfare process?

- Complexity of estimating relationship between services and outcomes
  - Disentangling the relationship between needs, services and outcomes
  - Effects take place over time
  - Different evaluative “traditions”
- Lack of large, quantitative evidence for analysis
  - Few large, longitudinal studies
  - Potential to use administrative data for evaluation?

# Number of ADLs limitations (Learning Disability group) LA2

ADL activities: Eating, Washing, Dressing, Toilet, Transfer

## Proportion of the population aged 80 or above (local authorities, England mid 2018)

Source: ONS

## Older community care users by service type – (LA 2)

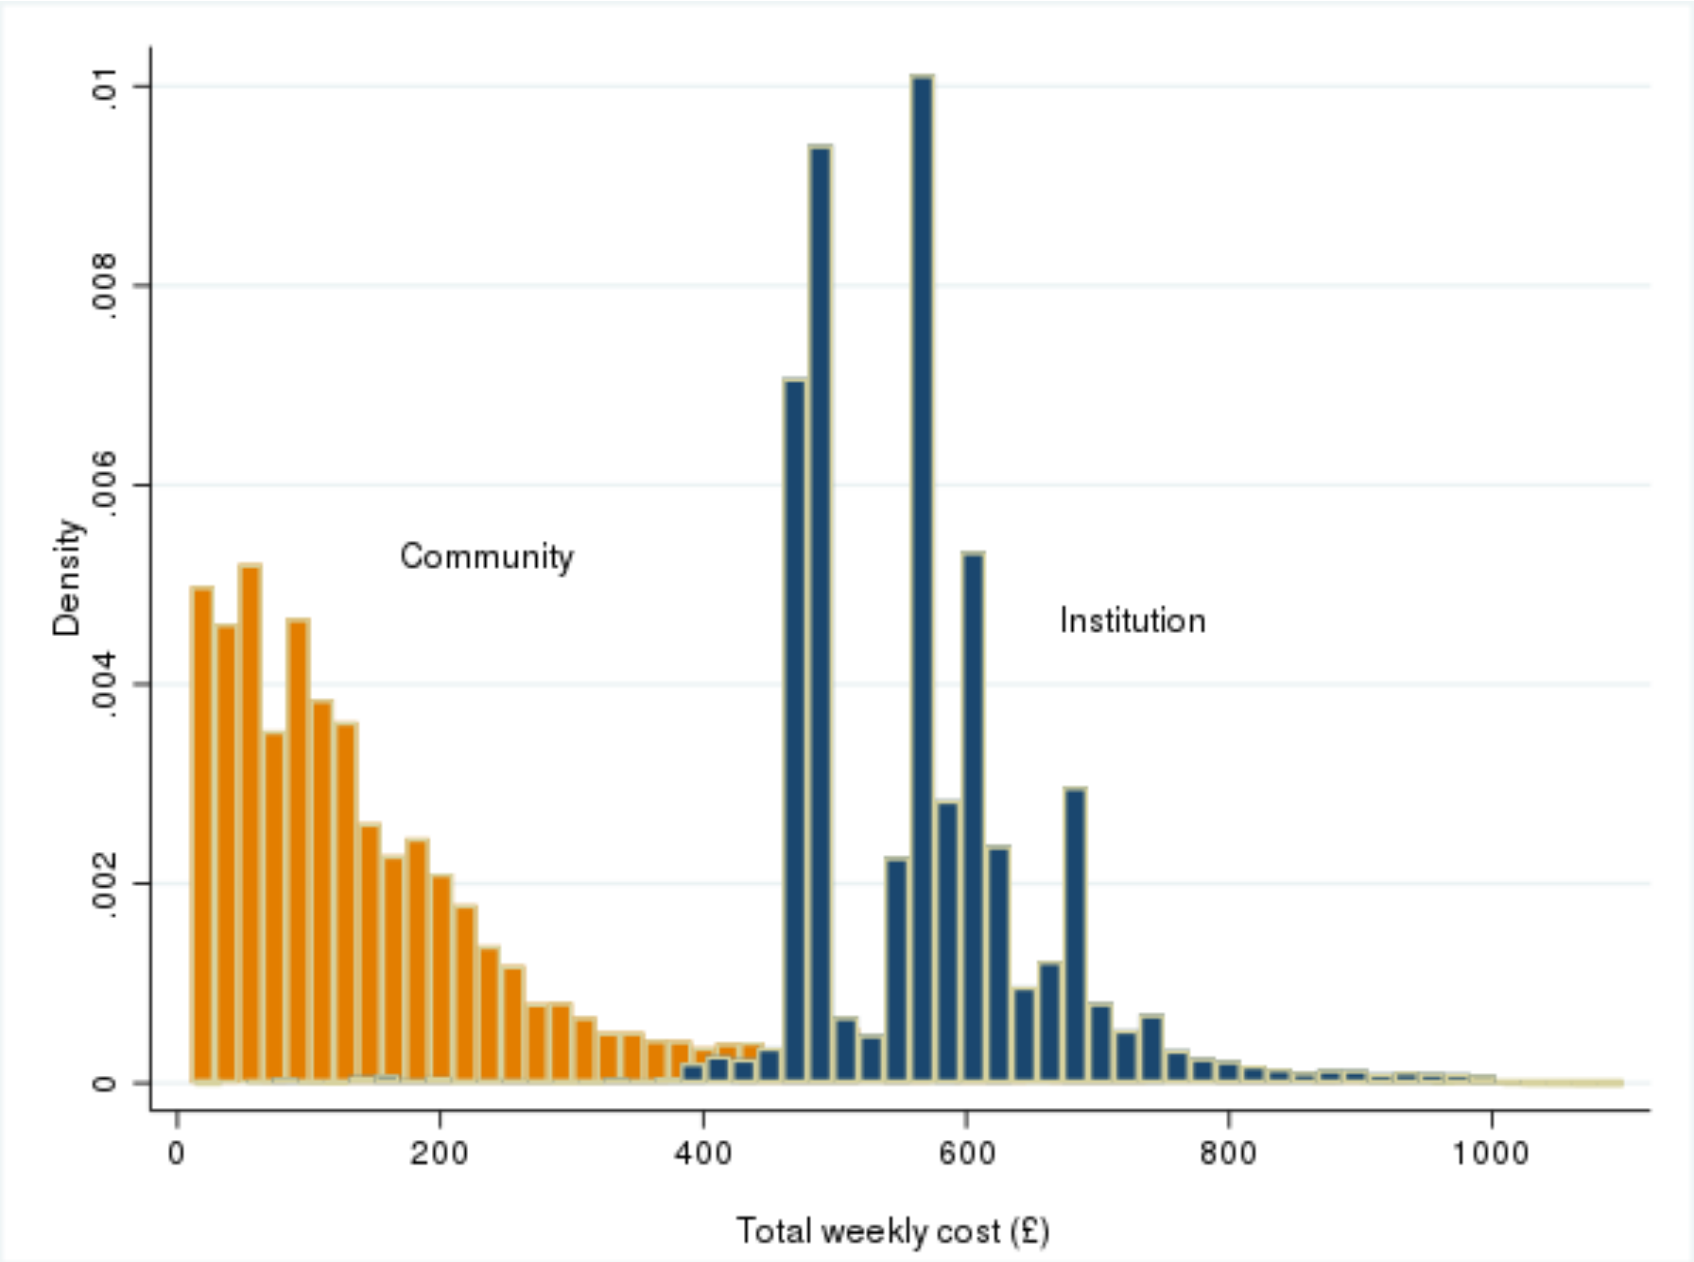

Long-term support needs of older adults (aged 65 and over) met by admission to residential and nursing care homes, per 100,000 older population (2018/19)

Number of council-supported older adults (aged 65 and over) whose long-term support needs were met by admission to residential and nursing care homes, per 100,000 population

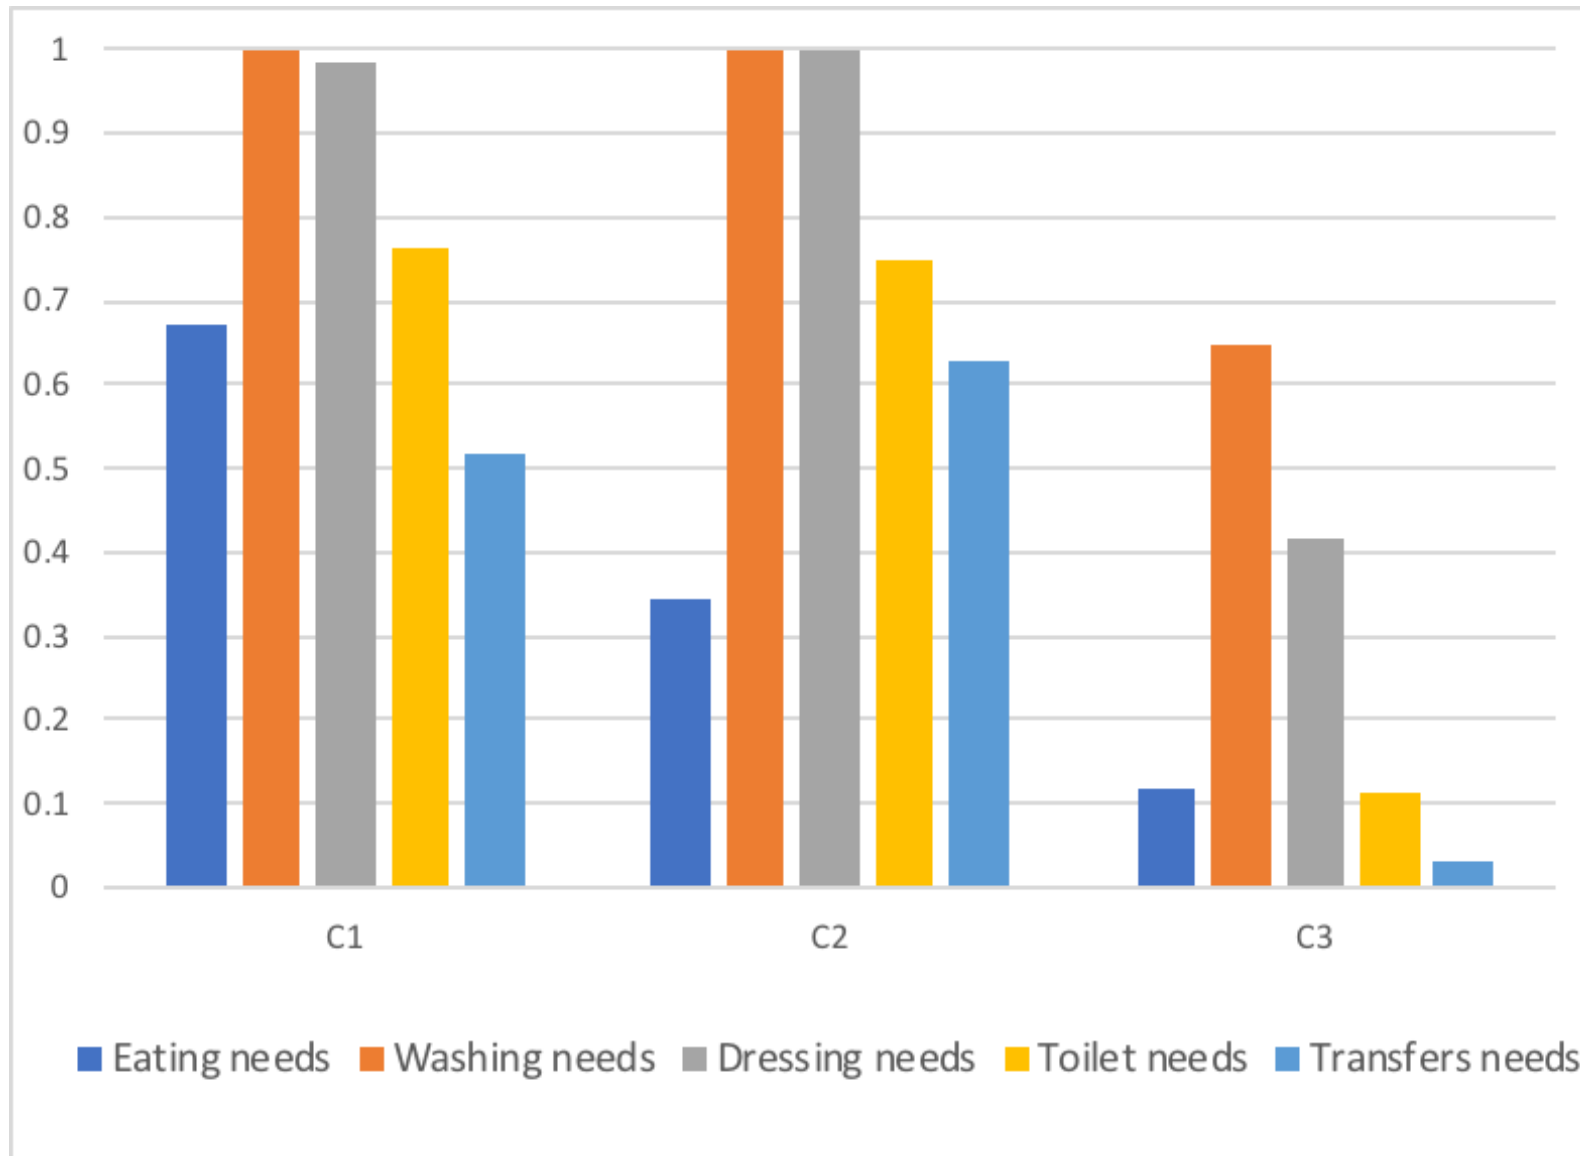

Source: NHS Digital

Distribution of total weekly costs by social care setting, older users – LA3

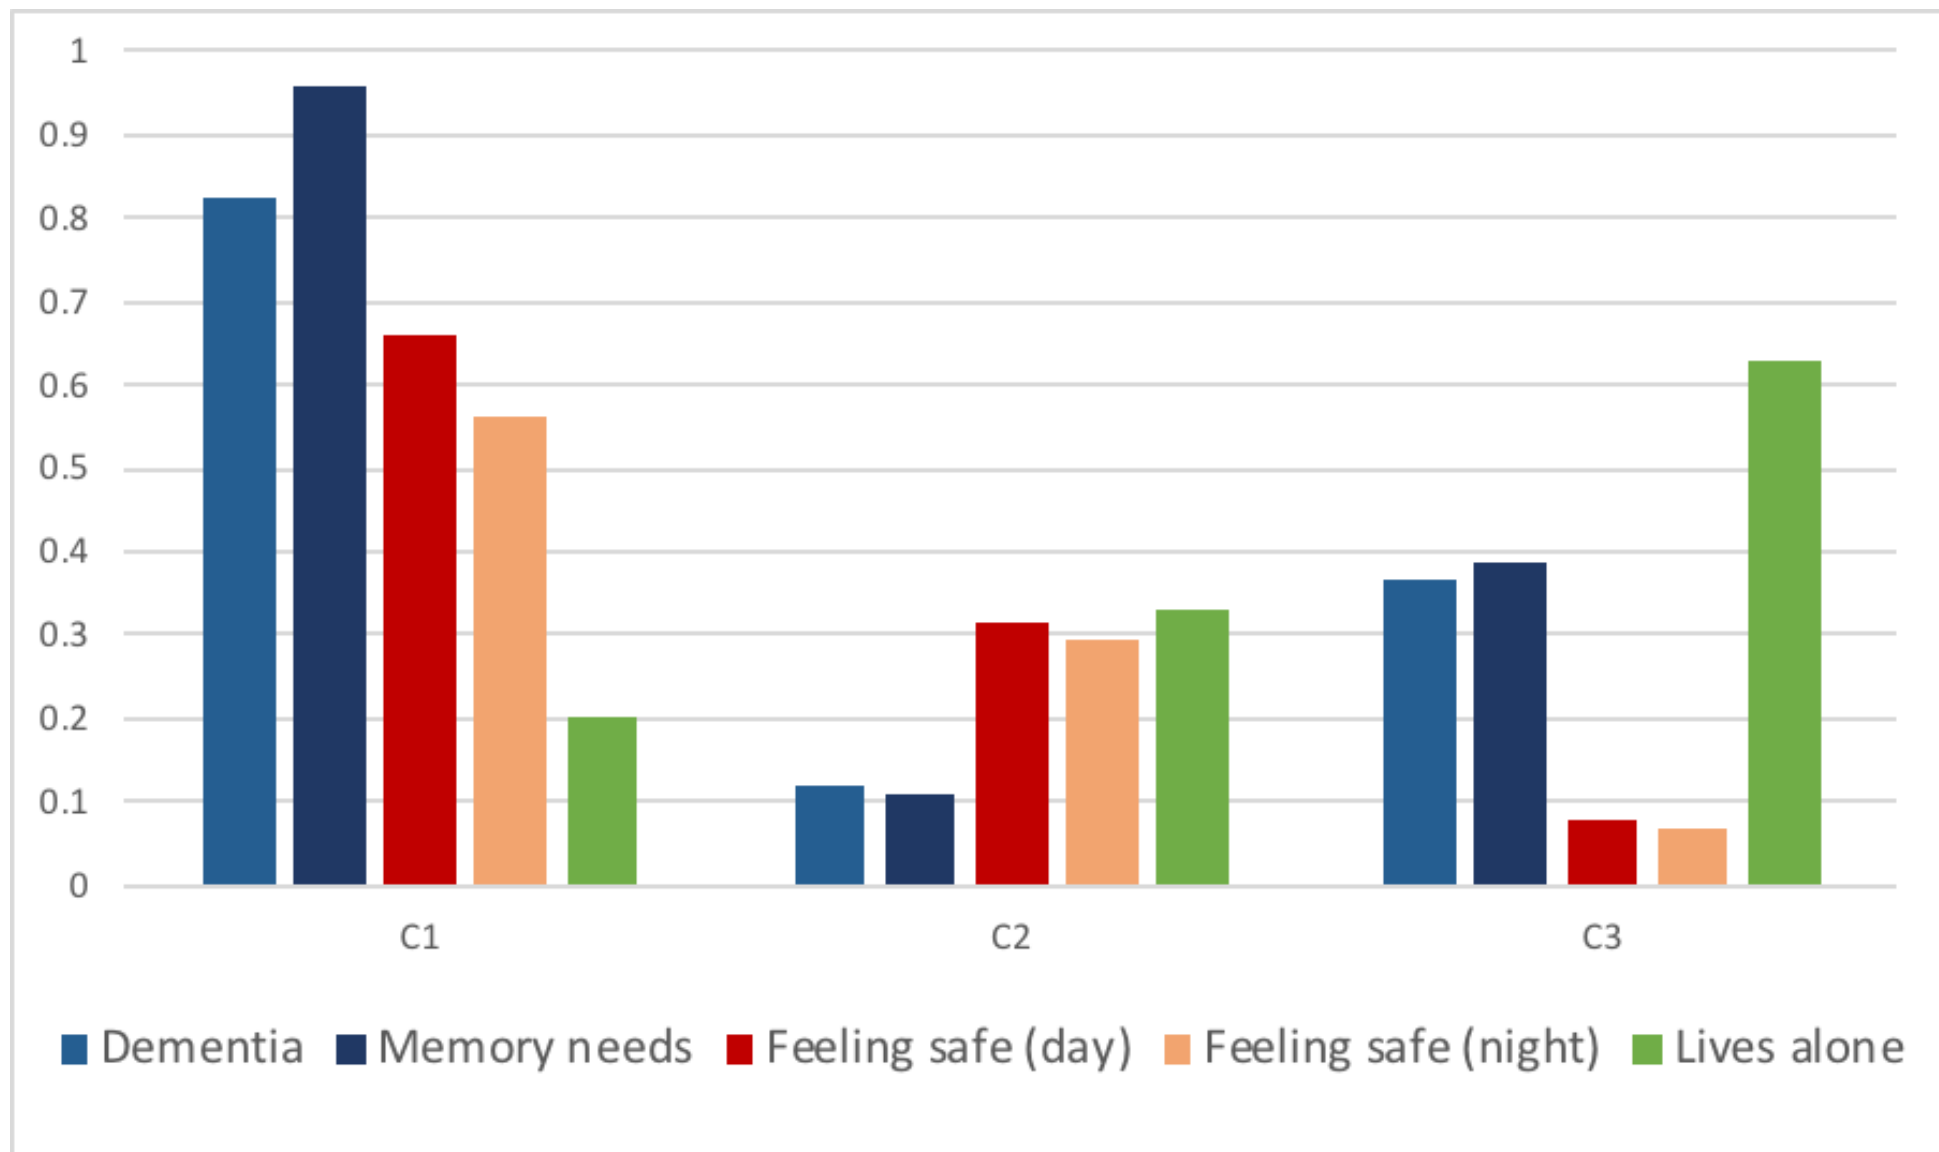

## Typologies of older clients – LA 2

### Problems with activities of daily living (ADLs)

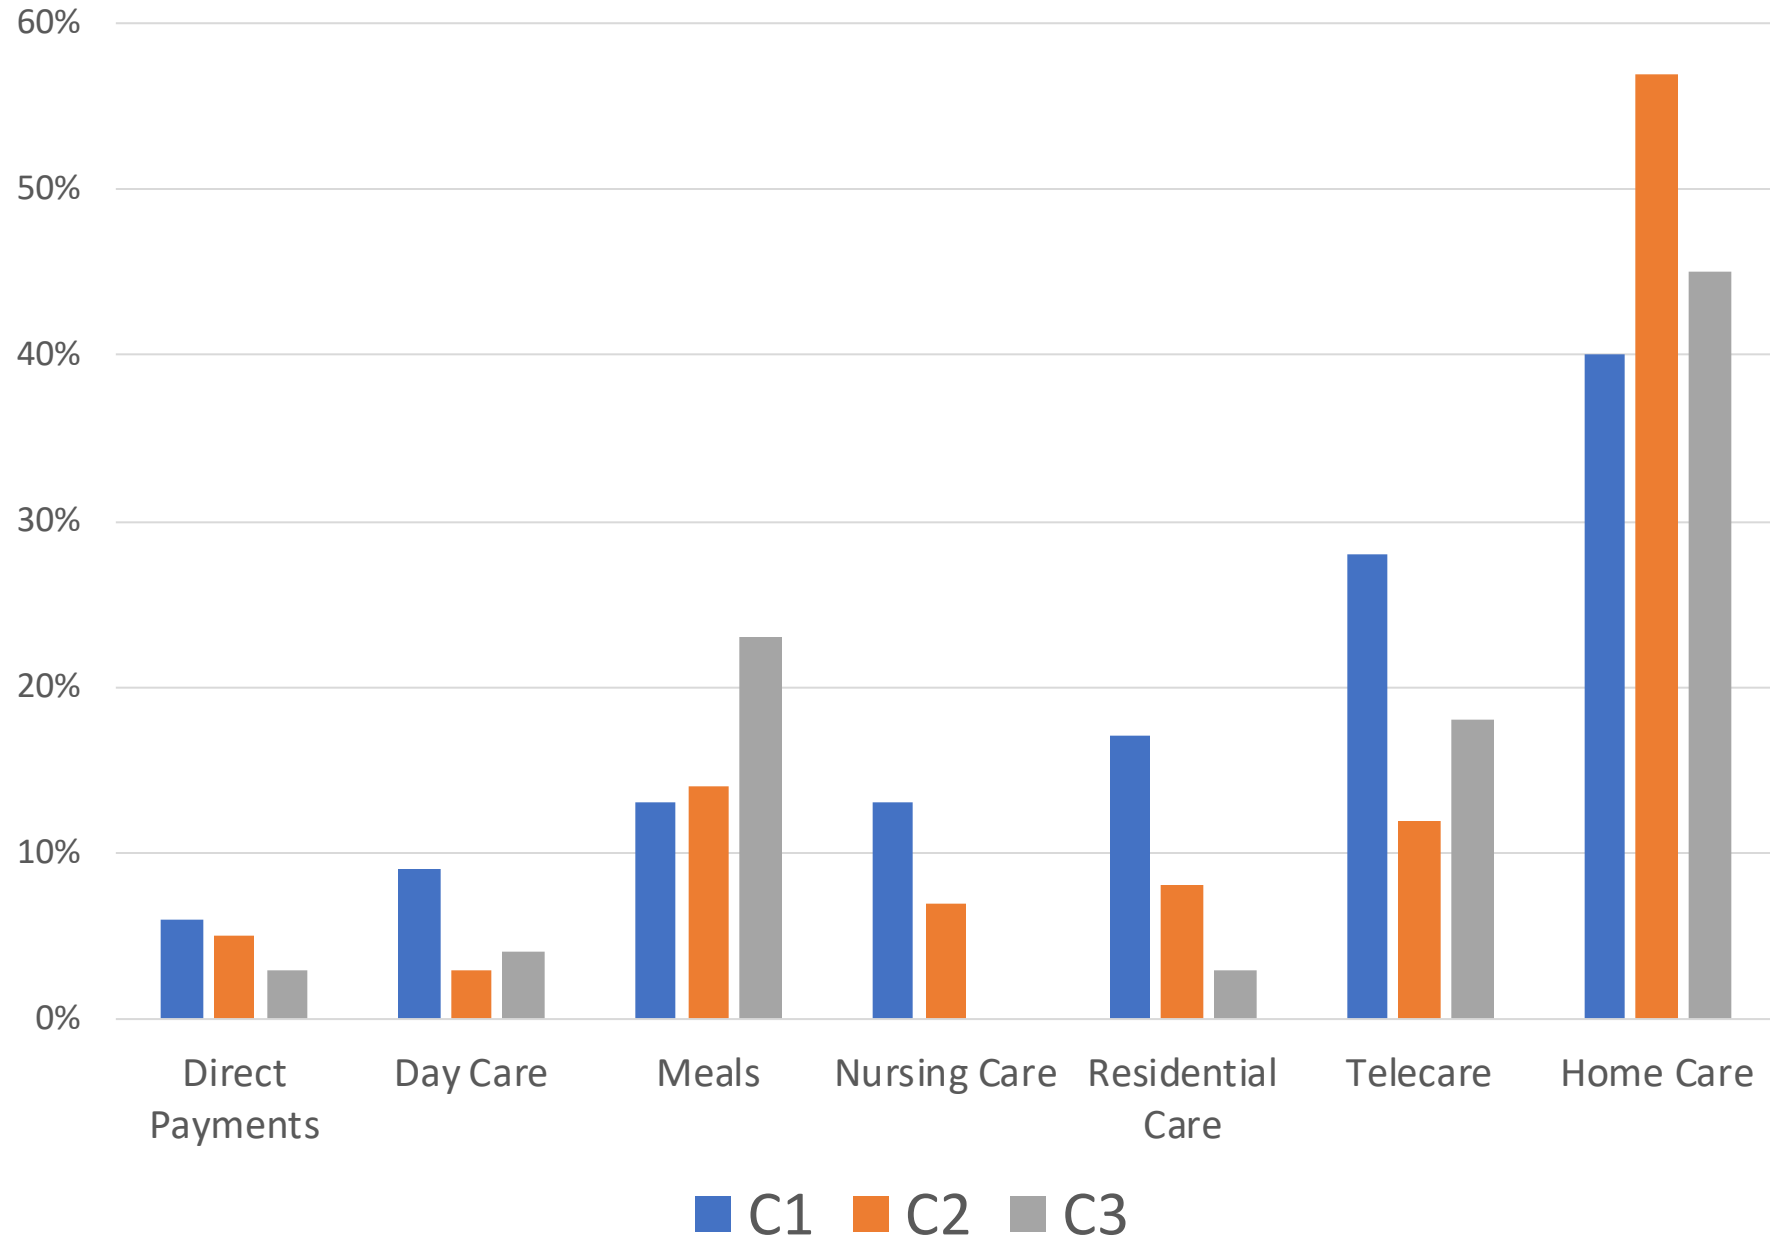

## Typologies of older clients – LA 2

### Other needs

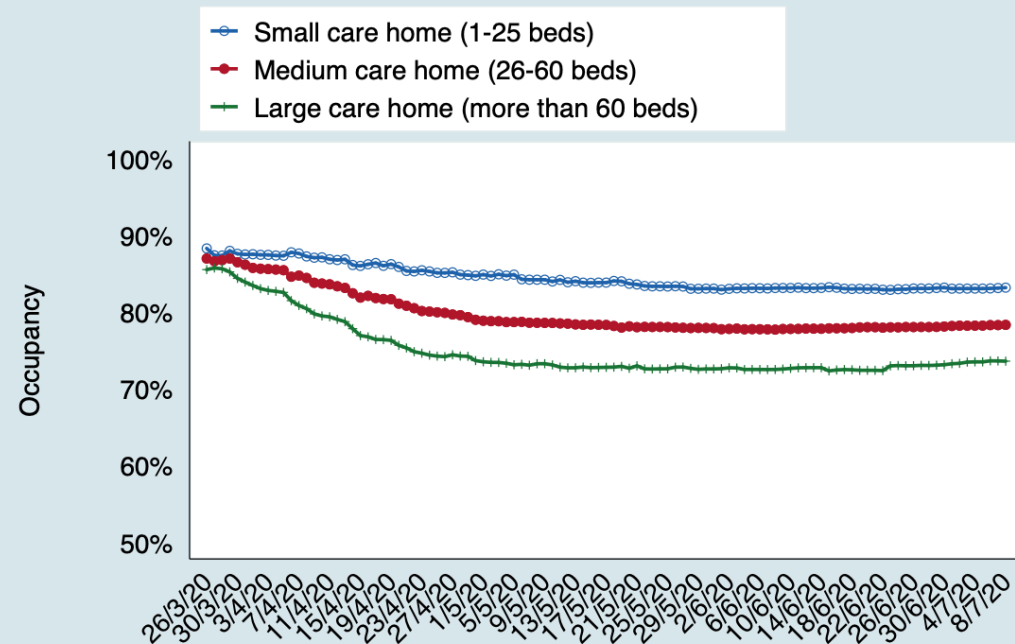

## Service use by older Class group (LA 2)

# Length of stay in residential care (days) for older people

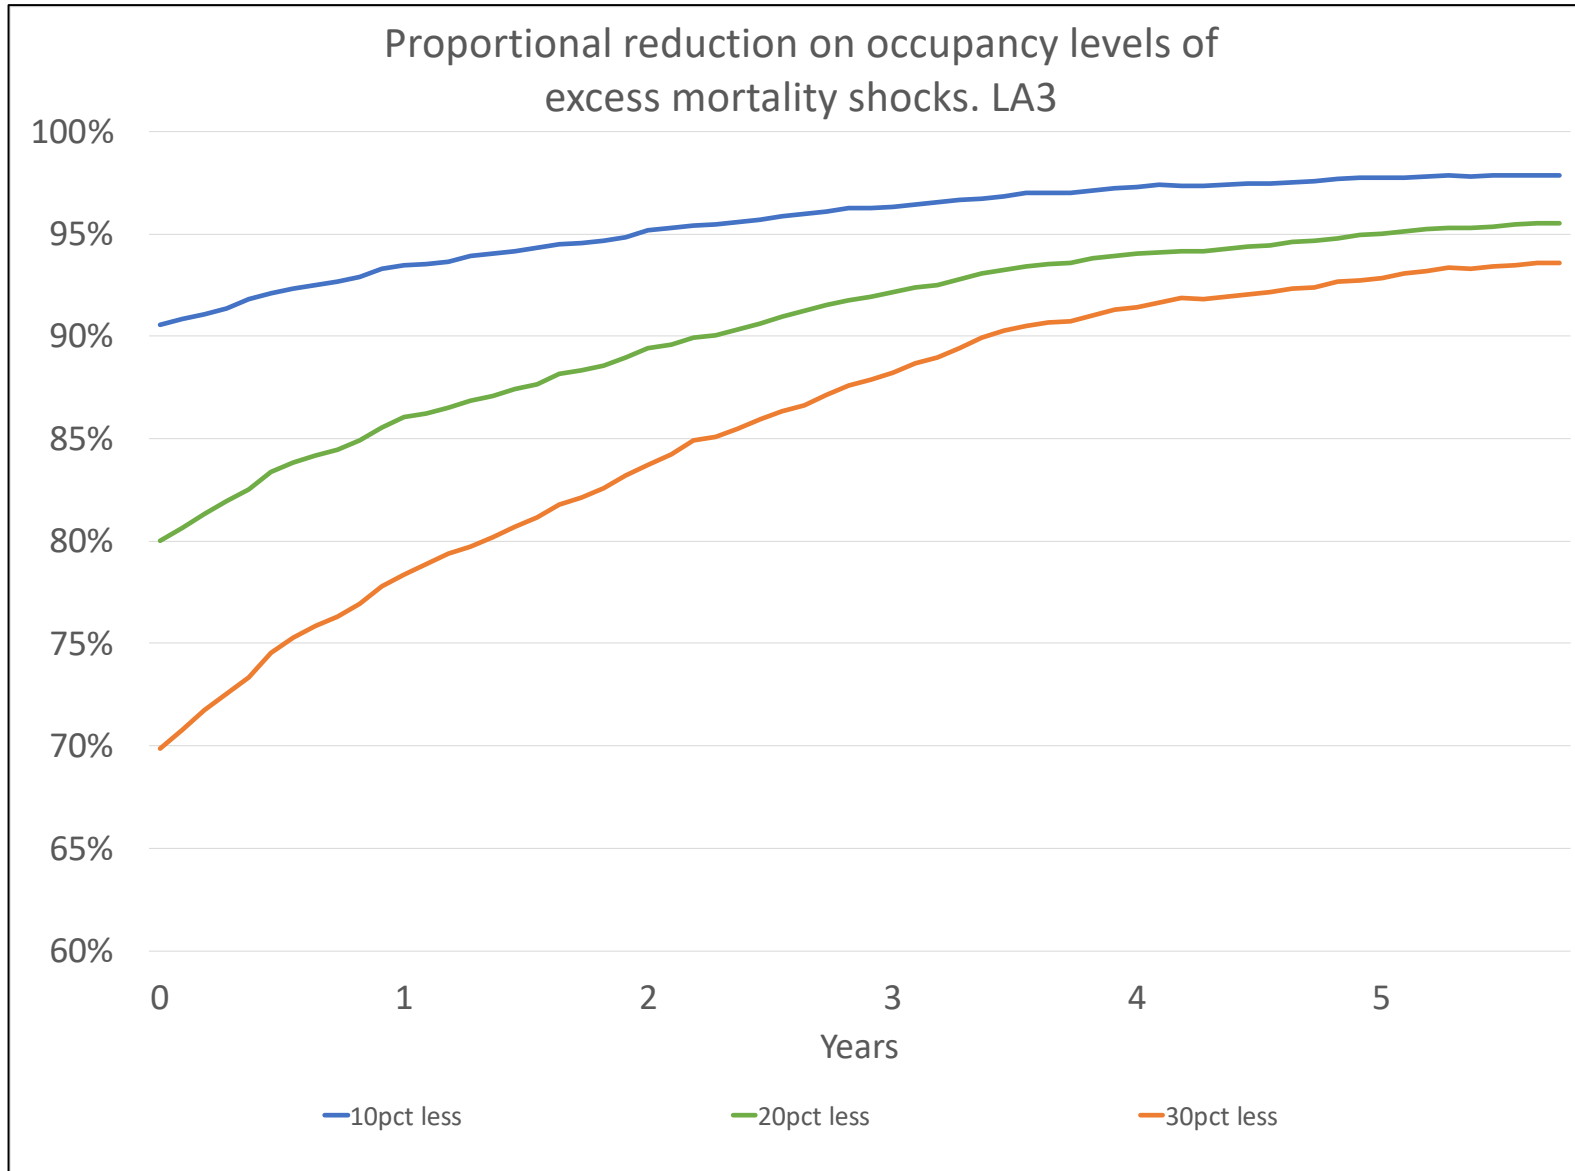

London: average ratio of residents to beds

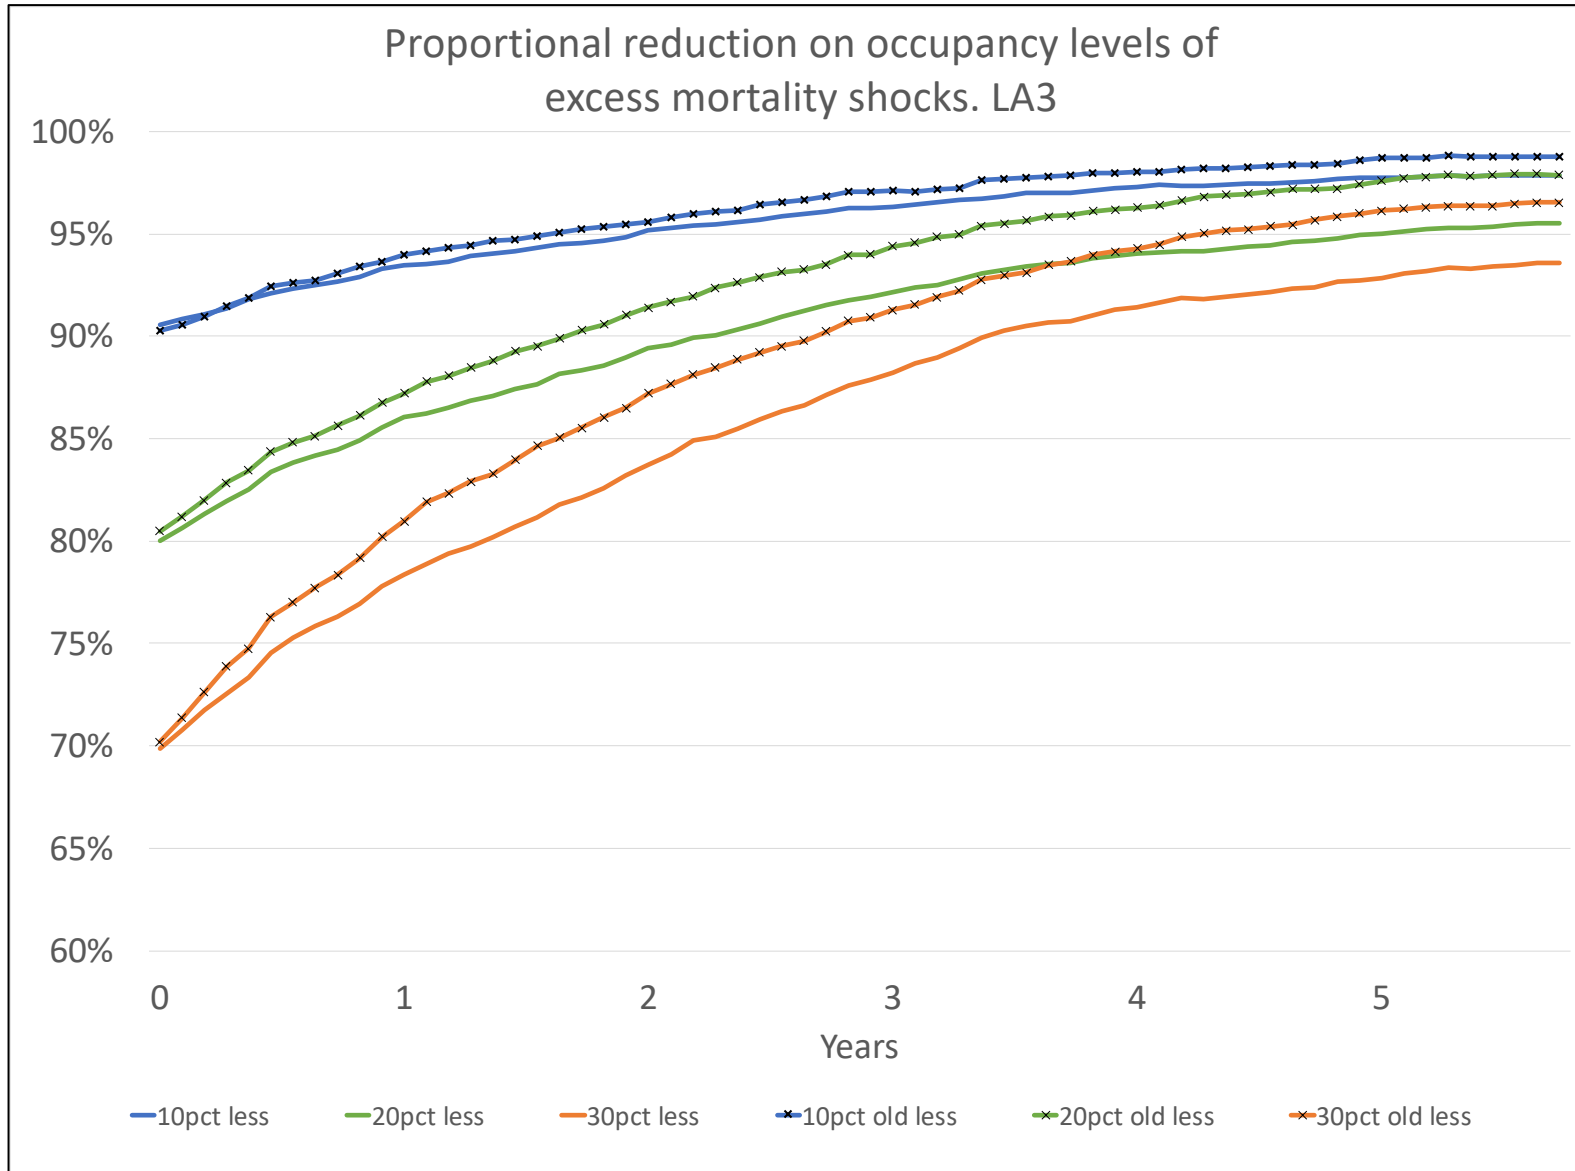

London: average ratio of residents to beds

# The challenges of estimating outcomes

- Lack of indicators of outcomes collected systematically by the system
  - Destinal outcomes (e.g. care home admission)
  - Death
  - Changes in needs as reflected in assessment
- Challenges of estimation because of the interrelationship between services needs and outcomes
  - Needs have a positive relationship on service intensity
  - Services should have a positive effect on outcomes (hopefully!)
  - Needs have a negative effect on outcomes

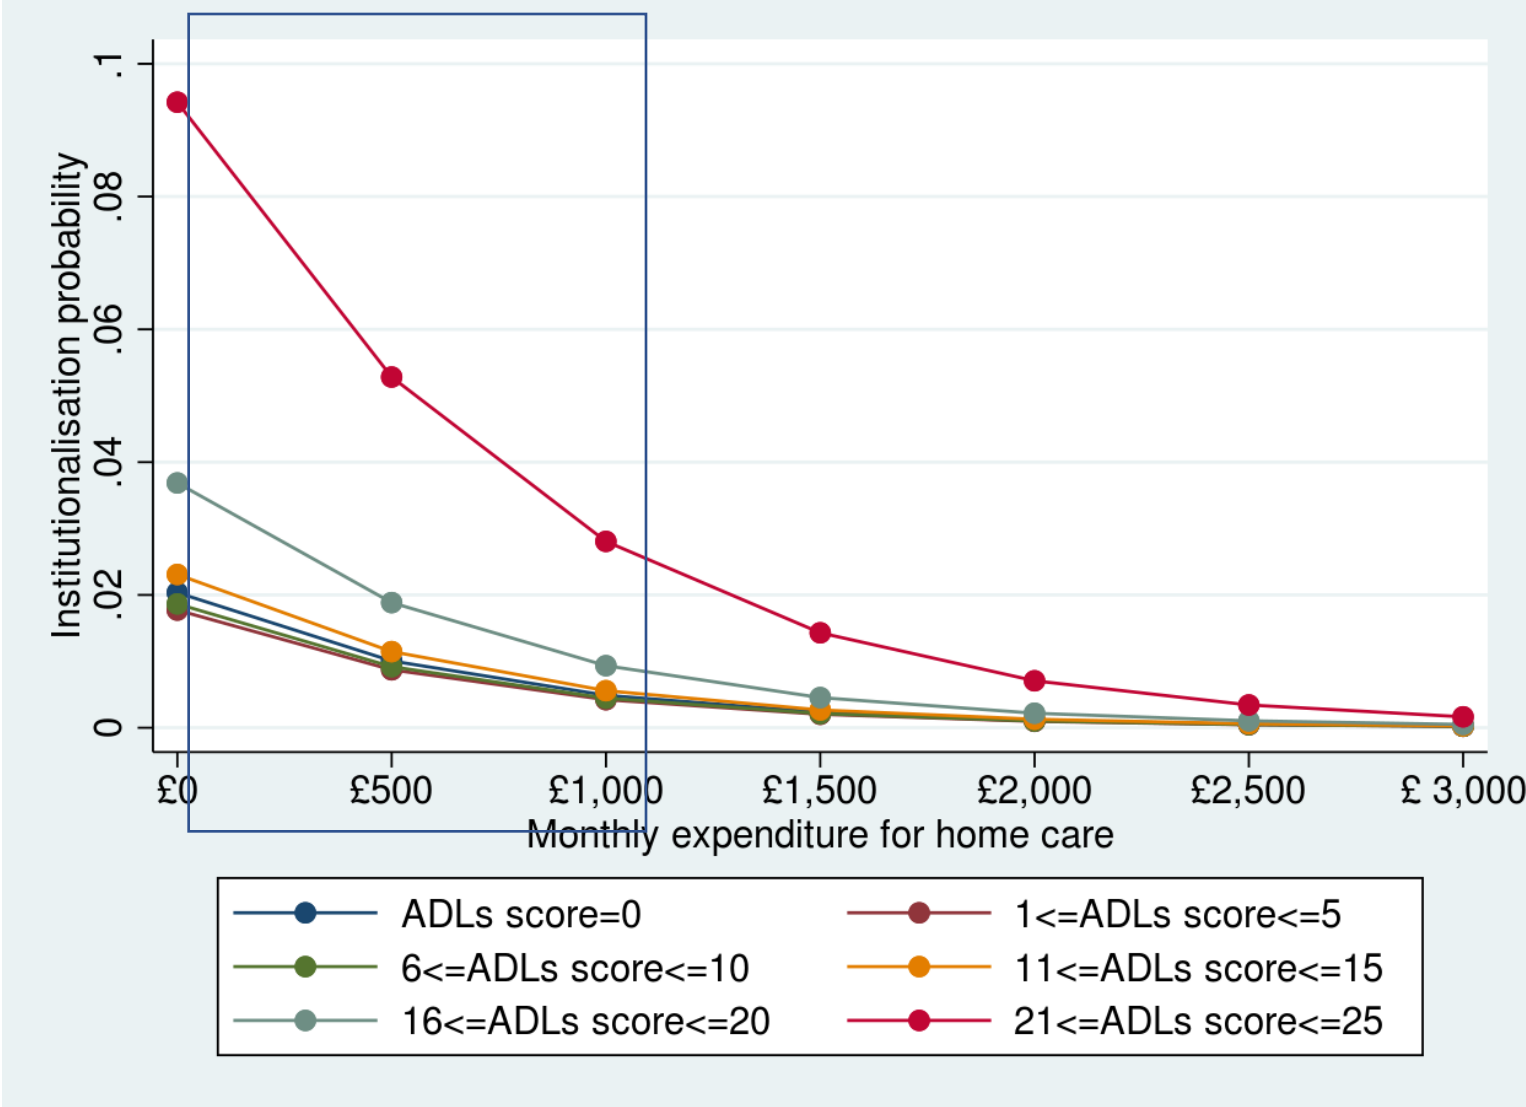

Outcome  
(e.g. quality of life)

## Probability of institutionalisation by user group at one-month since community services receipt

# Some conclusions...

- Administrative data has great potential for supporting the statistical analysis of the social care system
- But
  - Need to improve our understanding of how to interpret the data
  - Develop methods to assess impact of services on outcomes (data mostly non-experimental)
- Data gaps
  - Some services not covered: e.g. early intervention schemes (universal services; information and advice etc...)
  - Self-payers often not included
  - Outcomes: quality of life indicators not available
- Data comparability across areas is limited, which undermines our ability to learn across local experience
- Overcoming IG issues is very important, particularly with regards to:
  - linking of health and social care data (and from other systems: e.g. housing)
  - sharing data for research
